Professional Summary

Full Stack engineer with 13+ years of building and running business critical web products end to end. I shipped the ERP platform that 2,000+ companies run their daily operations on, and the cross-platform POS that syncs to it. Strongest in backend architecture, relational data modeling, and API design.

PROFESSIONAL EXPERIENCE

Senior Software Engineer - Wizard Solutions (full-time)

Jal El Dib, Lebanon | Feb 2018 – Present

- Led the migration of a legacy desktop ERP to a web platform (PHP, MySQL, JavaScript), owning application architecture and delivery. Started as the sole application engineer with one senior database developer; as the team grew to **7 engineers**, I led and coached developers and now work alongside other lead engineers. The platform serves **2,000+ business clients across Lebanon** on a recurring revenue model.
- Rebuilt the legacy POS as a cross-platform **Flutter + SQLite** application with local-first data, integrated with the core ERP through a REST API I designed and maintained.
- Ended silent truncation of large invoices in the shared sales/orders/purchases form (10,000+ fields posted per document) by moving to a single JSON payload instead of raising PHP's input limit.
- Identified missing **commit/rollback** on multi-step document saves (e.g. invoice → inventory → accounting). Raised it with leadership and aligned the team on wrapping those flows in database transactions, and on surfacing failures instead of swallowing them.
- Traced a **2+ minute** invoice save the database developer could not isolate to a nested function inside a **BEFORE INSERT** trigger; save time dropped to **3 seconds or less**.
- Extended **Yii 1.1** logging so production errors include tenant, logged-in user, originating SQL, and a full stack trace - cutting diagnosis time on a large codebase of pages, procedures, functions, and triggers. Logs are viewed in **AWS CloudWatch** (pipeline owned by DevOps).

Software Developer - Al-Kaff for Computer (full time)

Beirut, Lebanon | March 2013 - Nov 2017

- Rewrote the legacy payroll submission web app from scratch on a current PHP version and maintained other internal applications.
- Moved hosting off a Canada-based private provider onto a **Linode** Linux server I set up (Apache, MySQL) and led the database migration, cutting hosting from **~\$4,000/month to \$7.50/month** including backups.
- As the **sole developer**, built internal web applications automating **monthly payroll processing** for **400 companies** (2,000+ employees each) and **secure member ATM card issuance** and lifecycle operations.
- Resolved critical performance bottlenecks: migrated **MyISAM** → **InnoDB**, redesigned core table structures, eliminated N+1 queries, and refactored business logic cutting payroll processing from **10 minutes with timeouts to 5 seconds or less**.

TECHNICAL SKILLS

- Frontend:** React, Next.js, TypeScript, JavaScript, Flutter (Dart)
- Backend:** Node.js, PHP (Yii 1.1), Python, REST API design
- Databases:** PostgreSQL, MySQL, SQLite, MongoDB, Prisma ORM
- Architecture:** Modular monolith, REST, relational data modeling, performance tuning
- Platform:** Linode, GitLab, Git, Vercel, Render, Supabase, Neon
